### 1. Question 1 (30 points)

#### A. (20 points)

 hw2-q1.png

#### B. (5 points)

**Ans:** A TravelSegment could start or end at a Station that is not served by its associated TransportLine. This would be valid in the ER diagram because there is no constraint requiring the start and end stations of a TravelSegment to be among the stations served by that TransportLine.

To enforce this constraint, we must require that the start and end stations of a TravelSegment appear in the Serves relationship with the same TransportLine. In other words, a TravelSegment may only start and end at stations that are served by its associated TransportLine.

#### C. (5 points)

**Ans:** Add an attribute to the relationship `Serves` called `no_of_platforms`.  
Add an attribute to the Station entity set called `maximum_no_of_platforms`.

We then add a constraint that, for each Station, the sum of `no_of_platforms` across all TransportLines assigned to that Station does not exceed `maximum_no_of_platforms`.

**2. Question 2 (20 points)****A. 12 points****Ans:**

```
CREATE TABLE Artists(
ArtistID INT PRIMARY KEY,
Name VARCHAR(50) NOT NULL,
Nationality VARCHAR(50) NOT NULL,
BirthYear INT(4) NOT NULL
);

CREATE TABLE Customers(
CustomerID INT PRIMARY KEY,
Name VARCHAR(50) NOT NULL,
Email VARCHAR(100) NOT NULL
);

CREATE TABLE Artworks(
ArtworkID INT PRIMARY KEY,
OwnerID INT FOREIGN KEY REFERENCES Customers(CustomerID),
CreatorID INT FOREIGN KEY REFERENCES Artists(ArtistID),
Title VARCHAR(50) NOT NULL,
AYear INT(4),
Medium VARCHAR(50)
);

CREATE TABLE Exhibitions(
ExhibitionID INT PRIMARY KEY,
ExhibitionName VARCHAR(100) NOT NULL
);

CREATE TABLE DisplayedIn(
ArtworkID INT,
ExhibitionID INT,
PRIMARY KEY (ArtworkID, ExhibitionID),
FOREIGN KEY (ArtworkID) REFERENCES Artworks(ArtworkID),
FOREIGN KEY (ExhibitionID) REFERENCES
    Exhibitions(ExhibitionID),
StartDate DATE,
EndDate DATE
);
```

**B. 4 points**

**Ans:** We can create an assertion as follows

```
CREATE ASSERTION exhibition_cardinality
CHECK (
    NOT EXISTS (
        SELECT ExhibitionID
        FROM DisplayedIn
        GROUP BY ExhibitionID
        HAVING COUNT(*) NOT BETWEEN 5 AND 20
    )
);
```

**C. 4 points**

**Ans:** We change the cardinality on the Artists entity set from 0..\* to 1..\*. We also add the following assertion

```
CREATE ASSERTION artist_has_artwork
CHECK (
    NOT EXISTS (
        SELECT *
        FROM Artists A
        WHERE NOT EXISTS (
            SELECT *
            FROM Artworks W
            WHERE W.CreatorID = A.ArtistID
        )
    )
);
```

**3. Question 3 (40 points)****A. 4 points**

**Ans:** No they cannot.

If they did then the functional dependencies  $\text{PassengerID} \rightarrow \text{PassengerEmail}$  and  $\text{PassengerEmail} \rightarrow \text{PassengerID}$  would not hold.

**B. 4 points**

**Ans:** Yes. The functional dependency  $\text{TrainNo} \rightarrow \text{ConductorID}$  only ensures each train has one conductor, but it does not prevent multiple trains from having the same conductor.

**C. 6 points**

**Ans:** The candidate keys are  $\{\text{TrainNo}, \text{PassengerID}\}$  and  $\{\text{TrainNo}, \text{PassengerEmail}\}$ .  $\text{TrainNo}$  determines  $\text{DepartureDate}$  and  $\text{ConductorID}$ ,  $\text{PassengerID}$  determines  $\text{PassengerEmail}$ , and together  $\text{TrainNo}$  and  $\text{PassengerID}$  determine  $\text{SeatNo}$  and  $\text{BaggageQty}$ , giving all attributes. Since  $\text{PassengerEmail} \leftrightarrow \text{PassengerID}$ , replacing  $\text{PassengerID}$  with  $\text{PassengerEmail}$  also forms a key.

**D. 5 points**

**Ans:** The dependency  $\text{TrainNo} \rightarrow \text{DepartureDate}$ ,  $\text{ConductorID}$  violates 3NF because  $\text{TrainNo}$  is not a superkey and neither  $\text{DepartureDate}$  nor  $\text{ConductorID}$  is a member of any candidate key. All other dependencies satisfy 3NF because either the left-hand side is a superkey or the right-hand side attribute is a member of some candidate key.

**E. 2 points**

**Ans:** Yes, the decomposition has a lossless join.

$$R_1 \cap R_2 = \{\text{TrainNo}, \text{PassengerID}\},$$

which is a candidate key of  $R$  and therefore a superkey of  $R_2$ . By the lossless-join condition, a decomposition is lossless if the common attributes form a superkey of at least one of the relations, so the join is lossless.

**F. 2 points**

**Ans:** No, this decomposition does not have a lossless join.

$$R_1 \cap R_2 = \{\text{PassengerID}\},$$

which is neither a superkey of  $R_1$  nor of  $R_2$  (PassengerID alone does not determine DepartureDate or ConductorID, nor SeatNo or BaggageQty), so the lossless-join condition fails.

**G. 12 points**

**Ans:**

$F = \{ \text{TrainNo} \rightarrow \text{DepartureDate}, \text{TrainNo} \rightarrow \text{ConductorID}, \text{PassengerID} \rightarrow \text{PassengerEmail}, \text{PassengerEmail} \rightarrow \text{PassengerID}, (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{SeatNo}, (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{BaggageQty} \}$

$R(\text{TrainNo}, \text{PassengerID}, \text{PassengerEmail}, \text{DepartureDate}, \text{ConductorID}, \text{SeatNo}, \text{BaggageQty})$

i=0:  $R_1(\text{TrainNo}, \text{DepartureDate})$ ,  $F_1 = \{ \text{TrainNo} \rightarrow \text{DepartureDate} \}$

i=1:  $R_2(\text{TrainNo}, \text{ConductorID})$ ,  $F_2 = \{ \text{TrainNo} \rightarrow \text{ConductorID} \}$

i=2:  $R_3(\text{PassengerID}, \text{PassengerEmail})$ ,  $F_3 = \{ \text{PassengerID} \rightarrow \text{PassengerEmail}, \text{PassengerEmail} \rightarrow \text{PassengerID} \}$

$\text{PassengerEmail} \rightarrow \text{PassengerID}$ :  $R_3$  already contains  $\{\text{PassengerEmail}, \text{PassengerID}\}$  — skip

i=3:  $R_4(\text{TrainNo}, \text{PassengerID}, \text{SeatNo})$ ,  $F_4 = \{ (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{SeatNo} \}$

i=4:  $R_5(\text{TrainNo}, \text{PassengerID}, \text{BaggageQty})$ ,  $F_5 = \{ (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{BaggageQty} \}$

Merge  $R_1, R_2$  (same key  $\{\text{TrainNo}\}$ )  $\rightarrow R_1(\text{TrainNo}, \text{DepartureDate}, \text{ConductorID})$ ,  $F_1 = \{ \text{TrainNo} \rightarrow \text{DepartureDate}, \text{TrainNo} \rightarrow \text{ConductorID} \}$

Merge  $R_4, R_5$  (same key  $\{\text{TrainNo}, \text{PassengerID}\}$ )  $\rightarrow R_4(\text{TrainNo}, \text{PassengerID}, \text{SeatNo}, \text{BaggageQty})$ ,  $F_4 = \{ (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{SeatNo}, (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{BaggageQty} \}$

$R_4$  contains  $\{\text{TrainNo}, \text{PassengerID}\}$ , a candidate key of  $R$  — no additional relation needed.

**Output:**

$R_1(\text{TrainNo}, \text{DepartureDate}, \text{ConductorID})$ ,  $F_1 = \{ \text{TrainNo} \rightarrow \text{DepartureDate}, \text{TrainNo} \rightarrow \text{ConductorID} \}$

$R_2(\text{PassengerID}, \text{PassengerEmail})$ ,  $F_2 = \{ \text{PassengerID} \rightarrow \text{PassengerEmail}, \text{PassengerEmail} \rightarrow \text{PassengerID} \}$

$R_3(\text{TrainNo}, \text{PassengerID}, \text{SeatNo}, \text{BaggageQty})$ ,  $F_3 = \{ (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{SeatNo}, (\text{TrainNo}, \text{PassengerID}) \rightarrow \text{BaggageQty} \}$

**H. 5 points****Ans:**

Yes, all three relations are in BCNF. For every  $X \rightarrow Y$  in  $F$ , either  $X \rightarrow Y$  is trivial or  $X$  is a superkey:

- $R_1(\text{TrainNo}, \text{DepartureDate}, \text{ConductorID})$ : key =  $\{\text{TrainNo}\}$ . Both  $\text{TrainNo} \rightarrow \text{DepartureDate}$  and  $\text{TrainNo} \rightarrow \text{ConductorID}$  have  $\text{TrainNo}$  as LHS, which is a superkey.
- $R_2(\text{PassengerID}, \text{PassengerEmail})$ : keys =  $\{\text{PassengerID}\}$ ,  $\{\text{PassengerEmail}\}$ .  $\text{PassengerID} \rightarrow \text{PassengerEmail}$  has superkey LHS, and  $\text{PassengerEmail} \rightarrow \text{PassengerID}$  has superkey LHS.
- $R_3(\text{TrainNo}, \text{PassengerID}, \text{SeatNo}, \text{BaggageQty})$ : key =  $\{\text{TrainNo}, \text{PassengerID}\}$ . Both  $(\text{TrainNo}, \text{PassengerID}) \rightarrow \text{SeatNo}$  and  $(\text{TrainNo}, \text{PassengerID}) \rightarrow \text{BaggageQty}$  have the full key as LHS.
